RESTRICTED

Anomaly Classification Protocol

Site Virtus
Administrative Department

Document ID: AD-Protocol-005
Classification: Restricted(CL-2)

By Site Director Harry Thus

NOTICE FROM SITE-VIRTUS'S DIRECTOR
Morning Everyone,
This file is to solidify the safeness also to ensure the containment of SCPs.
As these protocols will be universally in place, whenever and wherever.
Failing to follow the Protocols may lead you and the others in danger,
non-standard objects are not part of this document, as they're self explanatory.

In addition, failing to follow protocols will be questioned.
Class-A personnel are forbidden to come into contact with any anomalies.
– Dir.Harry Thus

1.Classifications of Anomalies

1.1 Primary Classes

1.1.1 Safe Class:

Short explanation: A SCP with no psychological harm, effects or physical, instead it may benefit the person(s) that is subjected.

Detailed explanation: SAFE-class SCPs are anomalies that are easily and safely contained. This is often due to the fact that the Foundation has researched the SCP well enough that containment does not require significant resources or that the anomalies require a specific and conscious activation or trigger. Classifying an SCP as Safe, however, does not mean that handling or activating it does not pose a threat.

1.1.2 Euclid Class:

Short explanation: A SCP may or may not cause psychological harm, effects or physical, these classifications of an SCP have unpredictable actions or activities and require some resources to contain.

Detailed explanation: EUCLID-class SCPs are anomalies that require more resources to contain completely or where containment isn't always reliable. Usually this is because the SCP is insufficiently understood or inherently unpredictable. Euclid is the Object Class with the greatest scope, and it's usually a safe bet that an SCP will be this class if it doesn't easily fall into any of the other standard Object Classes.

1.1.3 Keter Class:

Short explanation: SCP's with this classification is considered harmful, when testing on them, it's required to have a MTF Unit on standby for re-containment and when breached Site Council members are to evacuate, as well as requiring more resources to contain.

Detailed explanation: KETER-class SCPs are anomalies that are exceedingly difficult to contain consistently or reliably, with containment procedures often being extensive and complex. The Foundation often can't contain these SCPs well due to not having a solid understanding of the anomaly, or lacking the technology to properly contain or counter it. A Keter SCP does not mean the SCP is dangerous, just that it is simply very difficult or costly to contain.

1.2 Secondary Classes

1.2.1 Thaumiel Class

Short explanation: SCP's in this classification remain classified in most documents, only a few personnel may know their existence (common sense any DHC, will know their existence, but not their status), only O5 Council members know their status and location.

Detailed explanation: Thaumiel-class SCPs are anomalies that the Foundation specifically uses to contain other SCPs. Even the mere existence of Thaumiel-class objects is classified at the highest levels of the Foundation, and their locations, functions, and current status are known to few Foundation personnel outside of the O5 Council.

1.2.2 Apollyon Class

Short explanation: SCP's in this classification are uncontainable or cannot be contained, a SCP with this classification is considered as "End of the world" or "K-Class scenario", this requires all personnel efforts.

Detailed explanation: Apollyon-class SCPs are anomalies that cannot be contained, are expected to breach containment imminently, or some other similar scenario. Such anomalies are usually associated with world-ending threats or a K-Class Scenario of some kind, and require a massive effort from the Foundation to deal with.

1.2.3 Archon Class

Short explanation: SCP's in this classification are best to be left alone, but must comply with it's demands if it can, since containing it may have bad effects nor simply so difficult to contain to the point that it's best to leave it alone.

Detailed explanation: Archon-class SCPs are anomalies that could theoretically be contained but are best left uncontained for some reason. Archon SCPs may be a part of consensus reality that is difficult to fully contain, or may have adverse effects if put into containment. These SCPs are not uncontainable - the defining feature of the class is that the Foundation chooses to not put the anomaly into containment.

1.2.4 Ticonderoga Class

Short explanation: SCP's in this class simply cannot be contained and also doesn't need to be re-contained, as they're deemed as "extraterrestrial beings" and they're beyond reach and resources of the foundation.

Detailed explanation: Ticonderoga-class SCPs cannot be contained, but also do not need to be contained. While these anomalies are similar to Archon-class SCPs in that their containment is unnecessary, Ticonderoga-class SCPs are distinguished by also not being containable given the Foundation's current knowledge and resources. This may be due to their widespread or ubiquitous occurrence on Earth, despite the general public remaining unaware of their existence or anomalous nature, although the Ticonderoga class also includes extraterrestrial anomalies beyond the current reach of the Foundation.

2. Protocols For Each Class

2.1 Primary Classes

2.1.1 Safe

SAFE Class-They're not harmful, no procedure nor protocols to be taken unless they're harmful, they can be re-contained easily through common knowledge or public information.

2.1.2 Euclid

EUCLID Class-There are specific units and procedures taken to recontain an SCP within this class, as well as logical and proper coordination of re-containing of an SCP. Ex; SCP-457 to re-contain him, you'd need a fire extinguisher or enough bucket of water or anything of a cold environment will suffice (ex; normal SCP:RP bunker's spray entrance).

2.1.3 Keter

KETER Class-SCPs in this class are obviously hard to recontain and a upmost top priority, specific procedures are stated and requires all units to respond, Non-combatants are to evacuate to a near shelter or wait it out, Site Council members are to evacuate quickly towards the helipad and must be transferred to a evacuation facility. Ex; Keteru Yamiko aka as SCP-040-JP to recontain her, the facility must put her posters as it's to "calm" her down in her rampage, as she cannot be seen or talked to as it is noted that people that are in her range of worthy can be seen or will not be harmed. (Lore added, the Director is schizophrenic)

2.2 Secondary Classes

2.2.1 Thaumiel

THAUMIEL Class-They're utmost important to be re-contained, as they do more harm than good, Non-combatants are to evacuate to the bunker, for Site Council members, they're transferred off-site at an instant and after the event below DHC are to given Class-B amnestics by force or voluntarily.

2.2.2 Apollyon

APOLLYON Class-There's no hope of re-containment, Site Council members are of utmost importance of having protection, the Site must still run but tightly, as in this class we're by ourselves and must continue on. If possible do a massive Site "cleansing", only Site Council members are to remain alive until help arrives, if there is any…

2.2.3 Archon

ARCHON Class-SCPs in this class must be closely FOLLOWED and obeyed by it's orders, by following it, will surely calm itself down, not following what they wish or demand for may cause more harm than before.

2.2.4 Ticonderoga

TICONDEROGA Class-There's no hope, as SCPs in this class are considered as "extraterrestrial beings" as well are beyond our reach, control and resources.
